

One main problem with these Chinese scooters is the exhaust, as soon as they come into contact with the elements they rust really quickly. Here's a picture of mine after just seven weeks, keep in mind it's under a cover all night, in a shed at work and I've only been out once when it's been raining:

Not very pretty is it??? 😞 You've got two options:

- 1) Leave it alone and let it rust away but try picking up a replacement without any hassle and try getting one for under £40 or....
- 2) Get yourself down to Halfords and buy a tin of Very High Temperature Engine Enamel Paint (Matt Black) for £5.99.

***(It's located alongside all the spray paint, usually on the top shelf near the Hammerite).***

**The blurb on the tin say's:**

Halford's Very High Temperature Paint is specially formulated to withstand temperatures of 650 degree's celsius. It provides a durable corrosion protecting matt finish to enhance the appearance of high temperature areas of engines. It's ideal for use on exhaust manifolds and many areas of air-cooled engines.

**To prepare the exhaust for painting either use a wire brush or some wet & dry paper. I'll be honest and tell you I gave mine a quick scrub with some dry kitchen roll but it did the trick: 😊**

Once most of the dirt & rust has gone give the exhaust one coat of paint and leave for around 30 minutes before applying a second coat.  
You should only need a couple of coats but feel free to do more.  
And here's the end result: 😊

Now doesn't that look a hell of a lot better than this plus at the same time you're protecting the exhaust against any further rust. 😊
